

GUIDE v.39.0 1.000-SE least-squares multiple linear regression tree (missing regressor values imputed) for predicting y_1 . At each split, an observation goes to the left branch if and only if the condition is satisfied. Intermediate nodes with splits due to interaction are in wheat color. Sample size (in *italics*) and mean of y_1 printed below nodes. Terminal nodes with means above and below value of 0.044 at root node are colored yellow and purple respectively. Second best split variable at root node is y_0 .
